Photoshop is the leading graphics application among the suites of software associated with the Adobe Creative Cloud subscription model. Its popularity, however, has had a detrimental side-effect for organizations that do their creative work, but wish to remain free of their subscription model. The program is so popular, in fact, that some users can no longer modify or distribute their own copies of Photoshop. All things considered, having the CS release as part of the Adobe Creative Cloud is a positive for the software suite. It means more products and more support from Adobe, so it's a win-win-win for those who buy it. With the 2018 update to Photoshop, the company has introduced a new feature aimed at "rendering" plants, animals, and other images that are difficult to render in ways that have never before been possible. In the new feature, the application now detects which media files you have opened and creates a special rendering profile for that media type. The result is resize-capable images that maintain crispness of some parts of the original image. The maximum resizing ratio is "1:1" in this release, which means that it can only resize an image by one pixel at a time. You cannot resize an image so that the new width and height are a different number of pixels. New in this release, you can now calibrate the levels of color information in an image. If you have a flat, square photo, it might look dull or flat in forms. This lets you decide to strip the edge of the image a bit to brighten it up, or not. You can also play around with the image's Tone Curve to get it to the colors you prefer.
